

	Period-I (1 st Period)	Period-II (2 nd Period)	Period-III (3 rd Period)	Period-IV (4 th Period)
Period	FY2011~FY2015 (5 years)	FY2016~FY2018 (3 years)	FY2019~FY2021 (3 years)	FY2022~FY2024 (3 years)
Research field and Achievements overview	<p>"Cutting, Processing, and Materials"</p> <p>We are developing ultra-precise and high-efficiency processing technologies for CFRP, lightweight metal components, and difficult-to-process materials that contribute to next-generation industries such as automobiles and aircraft.</p> <p>< Development Example > Cutting of aircraft jet engine combustor cases (used in the engine production process at Mitsubishi Heavy Industries, Ltd.)</p> 	<p>"Advanced Materials and Processing"</p> <p>We conduct research and development of advanced materials and processing technologies that support a wide range of fields, from food and biotechnology to the automotive and aircraft industries.</p> <p>< Development Example > Carbide powder for laser printing (commercialized by Fujimi Incorporated Co., Ltd.)</p> 	<p>"Manufacturing"</p> <p>We are engaged in the development of materials and processes using materials informatics, advanced processing technologies, and evaluation technologies to support them.</p> <p>< Development Example > High-efficiency additive manufacturing technology that adds functions to existing machine tools</p> 	<p>"Sophistication of Key Industries"</p> <p>We are developing processing, material, and recycling technologies that dramatically improve productivity, as well as visualization technologies that support them.</p> <p>< Development Example > Development of coils for quenching parts by additive manufacturing</p> 
	<p>"Food Safety and Security"</p> <p>We have developed a measurement device that quickly and accurately detects residual pesticides (hazardous chemical substances), solid foreign substances, and microorganisms mixed in food.</p> <p>< Development Example > Rapid and simple food poisoning bacteria inspection device (Productization by Tsuchiya co., ltd.)</p> 	<p>"Energy & Hydrogen"</p> <p>In addition to developing basic technologies such as the production and use of hydrogen, we are conducting research and development that will contribute to the formation of a hydrogen energy society in the near future.</p> <p>< Development Example > High-efficiency and high-durability hydrogen catalysts for hydrogen stations (Commercialized by Itochu Ceratec Corporation)</p> 	<p>"AI, IoT, and Big Data"</p> <p>In addition to promoting the use of AI and other technologies in a wide range of fields, from manufacturing to agriculture and health and longevity, we are developing technologies for robotics and optimal energy allocation.</p> <p>< Development Example > Platform to control multiple robots</p> 	<p>"DX (Digital Transformation)"</p> <p>We are innovating production processes using digital technology and developing robotics and autonomous driving technologies.</p> <p>< Development Example > AI medical record creation support system by voice input</p> 
	<p>"healthy Longevity"</p> <p>We are developing devices that contribute to the early diagnosis and treatment of biological information related to cerebral and cardiovascular diseases, cancer, and lifestyle-related diseases in a non-invasive and minimally invasive manner.</p> <p>< Development Example > Urine salt measuring device built into toilets (LIXIL Corporation is conducting demonstration tests)</p> 	<p>"Robotics and Automotive Safety"</p> <p>In addition to developing and demonstrating technologies for the use of robots, we are conducting research and development of automotive safety technologies using information and communication technologies.</p> <p>< Development Example > Harvesting support robot for sorting and packaging large leaves (commercialized by Sinfonia Technology Co., Ltd.)</p> 	<p>"Near-Future Vehicles"</p> <p>In response to the electrification of automobiles, we are developing high-performance inverters and motors, as well as developing technologies that contribute to autonomous driving and traffic safety.</p> <p>< Development Example > Autonomous driving and safe driving systems for MaaS</p> 	<p>"SDGs"</p> <p>In order to contribute to the SDGs, we will develop decarbonization technologies such as biomass and carbon cycle, as well as life sciences and smart agriculture technologies.</p> <p>< Development Example > Semi-closed greenhouses for optimal environmental control</p>
